

Math 81: Abstract Algebra

Prishita Dharampal

Problem 1. Archimedes discovered a construction that trisects any given angle using a compass and a “marked” straightedge. This straightedge has two special markings a distance 1 apart. The straightedge can be placed so that it passes through any already drawn point and such that both markings intersect other already drawn lines or circles.

In the picture, start with a horizontal line and another line meeting it with angle θ . Draw a circle of radius 1 around the intersection point of these two lines. The other line meets the circle at point A . Then place the marked straightedge so that it passes through the point A and such that the markings intersect the circle and the horizontal line. Prove that the angle φ that the straightedge makes with the horizontal line is equal to $\theta/3$.

Problem 2. Prove that any angle θ such that $\tan(\theta)$ is rational can be constructed with compass and straightedge. Prove that such angles are dense in the interval $(-\pi/2, \pi/2)$.

Problem 3. Prove that an angle θ can be trisected using compass and straightedge if and only if the polynomial

$$4x^3 - 3x - \cos(\theta)$$

is reducible over $\mathbb{Q}(\cos(\theta))$.

Bonus. Choose your favorite trisectable angle θ , and describe a step-by-step construction that performs the trisection; saying “I start with $\theta/3$ then triple it to make θ then I already have $\theta/3$ so I’m done” is cheating.

Problem 4. To 5-sect an angle means to divide it by 5.

1. Prove that the angles 2π , π , $2\pi/3$, and $\pi/2$ can be 5-sected by compass and straightedge.
2. Prove that a general angle cannot be 5-sected by compass and straightedge.

Problem 5. Let p be an odd prime.

1. Prove that both $\mathbb{Q}(\zeta_p)$ and $\mathbb{Q}(\zeta_{2p})$ have degree $p - 1$ over \mathbb{Q} .
2. Prove that both $\mathbb{Q}(\cos(2\pi/p))$ and $\mathbb{Q}(\cos(\pi/p))$ have degree $(p - 1)/2$ over \mathbb{Q} .
3. Find the minimal polynomial of $\cos(2\pi/9)$ over \mathbb{Q} and prove that it splits completely over $\mathbb{Q}(\cos(2\pi/9))$.

Problem 6. For $3 \leq n < 17$, determine whether a regular n -gon can be constructed by compass and straightedge.
