

Cosc 30: Discrete Mathematics

Prishita Dharampal

Problem 1. We are playing a solitary game by repeatedly flipping a fair coin and record the results. For each of the following property, compute the expected number of coin flips until that property holds for the flip sequence using random variables.

1. Two heads appear
2. Both a head and a tail have appeared (on different flips)
3. Two consecutive heads appear

Solution.

- 1.
